

22ND CENTURY MARKETING · MANUAL 1

Replace a \$1M Marketing Team with One AI Tool

The Toolkit. Install guide for the cmo-seat skill, worksheets and templates for every step of the CMO seat, and the nine-prompt pack.

\$39

Companion to the manual. Keep it open while you work.

You bought a seat, not a PDF.

The manual teaches the judgment. The skill puts that judgment inside Claude so it does the paperwork with you. The toolkit is the paperwork. Here's the order that works:

- **Read the manual once, front to back** (about an hour). Don't skip Part B; expectations and speed-to-lead are where most first months die.
- **Install the cmo-seat skill** (next page). Then run the kickoff on your own business or your first client.
- **Use the toolkit pages as you go.** Print them or fill them in with Claude. The templates are the same ones inside the skill.
- **Keep the prompt pack** for when you're on a phone, in ChatGPT, or helping someone who hasn't installed the skill.

What's in the download

File	What it is
Manual-1-Replace-a-1M-Marketing-Team-with-ToMarket.pdf	The 20-page manual. Parts A-E, twenty sections, sources.
Manual-1-Toolkit.pdf	This file: install guide, worksheets, templates, prompt pack, operator schedule.
cmo-seat.zip / cmo-seat.skill	The companion Claude skill (SKILL.md + references + templates).

Install the cmo-seat skill

The skill is the folder **cmo-seat/** inside **cmo-seat.zip** (also provided as **cmo-seat.skill**, the same zip with the extension Claude.ai expects). It contains SKILL.md, three reference files, and six templates.

- **Claude.ai (web or desktop):** Settings, then Capabilities or Skills, then upload **cmo-seat.skill**. Once it's on, just talk about your client's ads and Claude will pull it in.
- **Claude Code:** unzip so the folder sits at `~/.claude/skills/cmo-seat/` (personal) or `.claude/skills/cmo-seat/` inside a project. Type `/cmo-seat` or just describe the task.
- **Cowork or other Claude surfaces:** add it wherever that surface lets you add custom skills; it's the same folder.
- **No skill support at all?** Use the prompt pack in this toolkit. Every workflow has a copy-paste prompt.

Try it: "I just signed a roofing company in Tampa. Run the kickoff with me." Claude will interview you, do the math, and hand back a filled-in worksheet.

"Before I build anything, I need to understand this business better than the competitors understand theirs. Some of these questions are about money. Be straight with me, because I can't do this well if I'm guessing."

Business / niche / city / service area

When someone becomes a new customer, what are they worth on the first sale?

Do they come back? Over a year, what's a good customer worth?

Of that first sale, roughly how much do you keep after direct costs? (gross margin)

How many new customers a month could you actually handle right now? Where does it break?

When a lead comes in (form or call), who answers? How fast? What happens at 6 p.m. or on a Saturday?

Hours, and the area you actually serve?

What are you offering right now to get someone in the door?

Have you run ads before? What happened, what did you spend, do you still have the accounts?

Access and assets

- ☐ Meta Business Manager, Facebook Page, Instagram, ad account
- ☐ Google Ads (or note one must be created)
- ☐ Website URL and who controls it
- ☐ Logo and brand assets
- ☐ Photos and video of the real business, staff, work

☐ Where the best reviews live

Computed after the call

Gross margin -> break-even ROAS ($1 / \text{margin}$)

Customer value x close rate x margin ->
break-even CPL (aim for half)

Starting daily budget, and the one-sentence
reason

Speed-to-lead plan: who calls, within how many
minutes, after-hours

Send this before anything spends.

More marketing relationships die in the first thirty days than at any other time, and almost never because the ads were bad. They die because somebody expected something different than what happened.

Subject: How the first 30 days will go, [Business]

The first 30 days are a testing period. The platform tries several creatives, angles, and audiences and needs real spend and real results before it knows what works. Early numbers will bounce.

What a lead is. A person who gave us contact information asking to hear from you: a form fill or a call. Not a customer. I'm responsible for leads at a good cost. Turning them into customers is shared, and most of it happens on your side of the phone.

Speed-to-lead. Calling a lead within five minutes instead of thirty makes you 100 times more likely to reach them. I can send a perfect lead, and if someone calls it back tomorrow afternoon, it's dead. We need [name] calling these people back within [X] minutes, including [after-hours plan]. If that can't happen, tell me now.

Whose accounts. The campaigns run in your own Meta and Google ad accounts, on your payment method. You own the account, the pixel data, and the history.

Two money buckets. (1) Management cost: [software / my fee]. (2) Ad budget: what goes to Meta and Google. Nobody takes a cut of the ad budget.

Starting budget. Based on a customer worth \$[value] and capacity of [N]/month, we start at about \$[X]/day and tune once we see cost per lead.

How you'll hear from me. Three lines every [weekday]: results, what I did, what's next. Monthly, the return in dollars. Reply "agreed" and I'll build the department.

WORKSHEET 3

Offer and brief

Value = (Dream outcome x Perceived likelihood) / (Time delay x Effort and sacrifice). Raise the top, shrink the bottom. Then brief it like you're briefing a sharp new writer who's never met this business.

Value-equation check

Dream outcome (not "HVAC repair": a cool house tonight)

Perceived likelihood (reviews, guarantees, "we've done 4,000 of these")

Time delay (same-day, this week)

Effort and sacrifice (free estimate, no obligation, we handle the paperwork)

Lead-gen offer or direct sale? Why?

The brief

Business: [name], a [niche] in [city], serving [area]

The offer (with the number in it)

Who it's for (one line)

Why us / proof

How fast

The ask (CTA)

What happens after they respond: who calls, how fast

Hard rules: service area, things the business won't say, compliance words to avoid

Consistency check. Offer in the ad = offer on the instant form = first words of the callback. When all three say the same thing, cost per lead drops and leads stop feeling like strangers.

Ogilvy: the headline is eighty cents of your dollar. On social video the headline is the first three seconds.

Approve for hook rate (~25% average, 30%+ strong, 40%+ elite). Does this frame stop a thumb? A logo doesn't. A person mid-sentence saying something surprising does.

The copy checklist

- ☐ Leads with the customer's problem or dream, not the company name
- ☐ Follows PAS (Problem, Agitate, Solve) or AIDA: a hook, a reason to care, a clear ask
- ☐ Talks about *them*, not *us*
- ☐ Specific, not vague ("\$79 exam", "booked in 48 hours")
- ☐ Has proof: a number, a guarantee, a real review
- ☐ The CTA matches what actually happens next
- ☐ Nothing that violates platform policy or the brief's hard rules
- ☐ Offer in the ad = offer on the instant form = first words of the callback

Approved vs sent back (dentist)

Sent back	Approved
Opening frame: the practice logo. Copy: "Smith Family Dental, serving [town] for 20 years. Call us today!" Leads with the company, no hook, no offer.	Opening frame: a real patient mid-sentence, caption: "I hadn't smiled in photos for years." Copy: "Hate your smile? New patients get a full exam, X-rays, and cleaning for \$79 this month. Most people book same-week. Tap to grab a spot." Problem, dream, speed, offer, ask.

Google responsive search ads

15 headlines (up to 30 characters) and 4 descriptions (up to 90); Google assembles the combination per search. Coverage, not repetition: service, location, offer, proof, call to action, urgency, a question. Pin only what must appear. Call and location assets on, always, for local. Review against the search intent, not against your Meta creative.

Once it's live, leave it alone.

New CMOs see a scary number on day three and rip everything apart. The platforms need a learning period, and so does the engine. Yank the wheel and you reset the learning every time. The fastest way to a bad result is not leaving it alone long enough to get a good one. So get the checklist right, then let it run.

Setup

- ☐ Workspace created (one per brand or client)
- ☐ Meta connected: Business Manager, Page, Instagram, ad account
- ☐ Google Ads connected
- ☐ Brand kit built (logo, colors, assets from kickoff)
- ☐ Pixel / tracking healthy on the dashboard
- ☐ Payment method is the business's, in the business's accounts
- ☐ Slack (or approval channel) connected if you'll use it

Pre-launch

- ☐ Pixel healthy on the dashboard
- ☐ Running in the business's own accounts, on their payment method
- ☐ Offer in the ad = instant form = callback script
- ☐ At least 3-4 distinct creatives approved (several hooks, two formats, image + video)
- ☐ Google RSA: full headline coverage, minimal pinning, call + location assets on
- ☐ Goal mode: set-budget (move to scale once CPL holds)
- ☐ Starting daily budget defensible from customer value and margin
- ☐ Review level set: first weeks, see every action before it happens
- ☐ Someone ready to call leads back in minutes, with after-hours coverage
- ☐ Everything paused; nothing has spent yet

Three lines, same day every week, no exceptions. Consistency beats depth.

Week of [date], [Business]

1. **Results:** [X] leads at \$[Y] each. Spend: \$[Z]. Pixel: healthy.
2. **What I did:** [tested a new hook / switched to Higher Intent form / raised budget / retired two losers].
3. **What's next:** [what I'm testing or watching].

The monthly ROI sentence

Leads x close rate x average customer value, against spend, against break-even:

*"We spent \$2,000, generated 48 leads, closed 9, at \$1,200 each that's \$10,800.
Break-even was 2.0, we're at 5.4."*

That sentence renews a contract by itself. Use their real numbers.

Scaling check (both must be true)

- ☐ CPL holding at or under target for several weeks
- ☐ The business has capacity for more customers

Then it's math: "Leads at \$34, you're closing them, you said you can take ten more a month. If we add \$30 a day we should see roughly N more. Turn it up?" This is also when goal mode moves from set-budget to scale-while-KPIs-hold.

Testing order when something's off

1. Offer · 2. Angle / hook · 3. Format · 4. Headline · 5. Audience · 6. Small stuff. If leads are expensive, suspect the offer, not the headline. Check the non-ad causes first: pixel, speed-to-lead, and whether ad, form, and callback match.

TEMPLATE 7

Running several departments at once

One CMO can run marketing for many businesses, because the six seats under them are software. Batch by task, not by client.

Day	What you do
Monday	All weekly reports.
Tuesday - Wednesday	Creative day. Generate and approve new variants across every workspace. Preview widely, unlock narrowly.
Thursday	Numbers across every dashboard; troubleshooting by symptom.
Friday	Budget and scaling decisions; monthly ROI calls that are due.
Throughout	The engine runs the 90%; approvals as they come.

~\$1M

what an owner would pay to hire this department

\$3,000

a month, what they'll pay you for the result

\$500

a month in software and credits to deliver it

The operator's math

Roughly \$2,500 a month in gross margin per business, from a seat you can run for several businesses at once. The tool made the department cheap. The CMO seat, yours, is what the owner is actually paying for.

Mistakes that get a CMO fired

Overriding the rules engine on day three	Approving one ad
Launching with a weak offer	Sloppy credits: unlocking everything
Not defining "lead" up front	Mismatched offer across ad, form, and callback

Ignoring speed-to-lead	Scaling past capacity
Going silent	Blaming the ads, or the business, when it's the follow-up or the offer

For Claude without the skill, ChatGPT, or a phone. Paste, then paste your notes underneath. Each prompt tells the model to ask for what it doesn't have rather than invent it.

1. Kickoff

You are the chief marketing officer for a local business that is about to run Meta and Google ads. Before recommending anything, interview me to fill in this kickoff worksheet, a few questions at a time, defining any term the first time you use it:

- customer value on the first sale, and over a year
- gross margin on that first sale
- monthly capacity for new customers, and where it breaks
- who answers a new lead, how fast, and what happens after hours
- hours and service area
- the current offer
- past ad history and account access

Then compute: break-even ROAS (1 divided by gross margin), maximum affordable cost per lead (customer value x close rate x margin, stating the close rate you assumed), and a starting daily budget worked back from value and capacity (floor about \$50-\$100/day for most local lead gen). Finish with the filled-in worksheet, those three numbers, and a list of what is still missing. Never invent my numbers; ask for ballparks.

2. Expectations letter

Write a short expectations note to the owner of [business] before their ads start. Cover: the first 30 days are a testing period and early numbers bounce; what a lead is (contact info, not a customer); speed-to-lead with the MIT and HBR research and a named person calling back within minutes including after-hours; that campaigns run in the business's own ad accounts on their payment method; two separate money buckets (management cost vs ad budget, nobody takes a cut of the ad budget); the starting daily budget and why; and a three-line weekly report on a fixed day. Plain language, under 400 words, end with 'Reply agreed.'

3. Offer and brief

Act as CMO for [business, niche, city]. Customer value \$[X], margin [Y]%, capacity [N]/month. Propose three offers using the value equation (dream outcome x perceived likelihood, divided by time delay x effort). Say whether this should be a lead-gen offer or a direct sale and why. Pick the one to launch first. Then write a creative brief with: business, exact offer, who it's for, dream outcome, why us / proof, how fast, the ask, what happens after they respond, and hard rules (service area, things we won't say, compliance words to avoid). Ask me for anything you don't have.

4. Creative review

Review these ad creatives as a direct-response CMO. For each one give a verdict, APPROVED or SENT BACK, with one or two sentences against this standard: leads with the customer's problem or dream (not the company name or logo); follows PAS or AIDA; talks about them not us; specific numbers; proof; the CTA matches what happens next; no policy or brief violations; the offer matches the instant form and callback. For anything sent back, rewrite the opening line or first three seconds. Remember Meta is interruption (name the problem first) and Google is intent (match the search). Creatives: [paste]

5. Google RSA

Write a Google responsive search ad for [business, offer, city]. 15 headlines of up to 30 characters covering distinct angles (service, location, offer, proof, call to action, urgency, a question), not fifteen versions of one idea; 4 descriptions of up to 90 characters. Show the character count next to each. Tell me what, if anything, to pin, and remind me to turn on call and location assets.

6. Launch check

Walk me through a pre-launch checklist for [business] and don't let me skip an item: pixel healthy; running in the business's own accounts; offer in ad = form = callback; at least 3-4 distinct approved creatives; RSA coverage with minimal pinning and call/location assets; goal mode set-budget; a starting daily budget defensible from customer value \$[X] and margin [Y]%; review level for the first weeks; a named person calling leads back within minutes; everything paused. Ask me each item and record my answer.

7. Read the dashboard

Here are this week's numbers for [business]: spend \$[], leads [], CPL \$[], CTR []%, hook rate []%, CPM \$[], pixel [status]. Customer value \$[X], margin [Y]%, close rate [Z]%. Read them like a CMO: pixel first, then CPL against my target CPL (half of value x close rate x margin), creative health (CTR, hook rate), CPM, ROAS against break-even (1 / margin). Compare to WordStream medians for [niche], saying they're directional. Give one verdict: let it run, feed a challenger (which lever, in the order offer, hook, format, headline, audience, small stuff), or stop-work.

8. Troubleshoot

Symptom: [high CPM / low CTR / clicks but no leads / junk leads / leads nobody calls / a winner dying / disapprovals / pixel red]. Business: [niche, offer, form type]. Before touching the ads, check the non-ad causes with me: is the pixel healthy, is someone calling leads back within minutes (ask for timestamps), do the ad, instant form, and callback say the same thing. Then diagnose the likely cause and the single next test, using the order offer, angle/hook, format, headline, audience, small stuff. Don't rebuild the campaign.

9. Weekly report and ROI

Write my three-line weekly report for [business], week of [date]: 1. Results: [X] leads at \$[Y], spend \$[Z]. 2. What I did: []. 3. What's next: []. Then, if it's month end, write the one-sentence ROI line: leads x close rate x customer value against spend against break-even (1 / margin), using: [numbers]. If CPL has held at target and the business has capacity, draft the budget-raise ask with the math; if not, say which condition is missing.

22ND CENTURY MARKETING

Roemer AI Solutions

You're sitting in the seat now. Feed it a real offer built from real research, approve for the hook, let the engine do the ninety percent, read the numbers against the benchmarks, and tell the truth every week.

Do that and you're running a million-dollar marketing department for the price of a phone bill.

Questions, or a case you want a second pair of eyes on: reply to the email that delivered this bundle.

Sources for every benchmark and study are in section 20 of the manual.
